1. INTRODUCTION

1.1. SCOPE

The scope of the ImmPort contract is to provide advanced information technology support in the production, analysis, archiving, and exchange of scientific data for a diverse community of life science researchers.

1.2. PURPOSE

The Immunology Database and Analysis Portal (ImmPort) applications are being developed by a Peraton-led team. Previous development was performed by the same team under Northrop Grumman Information Systems (NGIS) with academic partners from the University of California San Francisco in the current contract (phase 2 and 3) and the University of Texas-Southwestern in the prior phase 1 contract. The ImmPort system is intended to serve as a long-term, sustainable archive of data generated by investigators funded through the Division of Allergy, Immunology and Transplantation (DAIT) of the National Institute of Allergy and Infectious Disease (NIAID), National Institutes of Health (NIH). The ImmPort system consists of an extensive data warehouse containing an integration of experimental and clinical data supplied by NIAID/DAIT-funded investigators. The ImmPort system is freely accessible as a resource to all scientists in the research community.

This System Architecture and Software Design Specification (SASDS) defines the overall ImmPort architecture and software design specification identified by the Peraton ImmPort Team (hereinafter referred to as the ImmPort Team) for the ImmPort system developed for NIAID/DAIT. The architecture and design described in this document focuses on the capabilities that are implemented in the ImmPort family of applications as of June 30, 2021.

1.3. BACKGROUND

The key objective of the SASDS version 6.0 is to provide an update to the hardware and software specifications of the system. The ImmPort project has evolved, such that systems are now hosted in a production or near production mode at both the NIAID hosting facility as well as Amazon Web Services (AWS) cloud environment. In general, the long term goal, which is in progress, is to provide hosting of data while it is private and being QC'ed and curated in ImmPort related applications housed at the NIAID hosting facility. When data is shared to the general scientific community, data would be transferred to AWS for easier re-use of these data for analysis, or in short, to bring the data to the analysis tool. This bifurcation of systems allows ImmPort and NIAID staff to maintain maximum control over data while it is sensitive and private, and more flexibility for re-use and distribution when the data is shared in AWS.

The ImmPort contract includes a shift in focus to lessen the level of effort spent on the development, maintenance and outreach for analysis tools and reference data capabilities. The FLOCK flow analysis tool suite continued to have constant usage and increased interest and publications related to tool usage and results, so the decision was made to continue support of that application. As a result of these decisions, the retired tools and queries will not appear in this design document.
For the remaining features of ImmPort, it was recognized a general code refresh was necessary given the overall age of the software and supporting stack of frameworks. As a result, the ImmPort team progressed incrementally through the upgrade of features into a new software architecture detailed in this document. For the purposes of this document, newer code architecture is referred to as "ImmPort 3.0", while the prior architecture being gradually replaced is referred to as "ImmPort 2.0". This document will detail the ImmPort 3.0 architecture for features that have been upgraded or will soon be upgraded, and will keep the existing documentation in place for ImmPort 2.0 features not yet upgraded in the production environment. As features are completed, this document will be accordingly updated. The functional requirements documents for features in progress for upgrade will also be available and referenced in this document.

Compared to prior versions of this document that detailed ImmPort 2.0 architecture, the overall system architecture for ImmPort 3.0 is being simplified to have a less dense middle-tier. As a result, the need to document detailed design packages in this SASDS is reduced, since the same middle-tier approach is utilized across the features in a given application and the EJB tier has been removed.

The database documentation has been moved online, so is no longer described in detail in this document. References to the freely available online materials will be provided in this document. Far more detail about the database fields, tables and ERD diagrams are available online than in prior versions of the SASDS, so the overall amount of information has increased markedly. Additionally, since the SASDS document was released the entire database in MySQL is available for anyone to download and re-use, making comprehension of the database architecture much simpler.

This document is to be considered a “work in progress” and will evolve during the life of the ImmPort effort as additional requirements are implemented, new requirements are identified, and others are modified or deleted.

2. IMMPORT TOOLS ON AMAZON WEB SERVICES

The ImmPort tools deployed on Amazon Web Services (AWS) are designed primarily to:
1. Identify studies of interest for users to evaluate for future analysis. The application performing this feature is ImmPort Shared Data.
2. Download studies of interest. The application performing this feature is ImmPort Data Browser.
3. Provide a unified platform for several ImmPort resources such as documentation, tutorials, upload templates, example packages, blogs. The application performing this feature is ImmPort Portal.

In addition to the above applications, the AWS infrastructure is utilized to develop Alpha and Beta tools to obtain feedback on utility from the user community. Tools such as ImmuneXpresso and the Cell Ontology browser fit into this category. Finally, the AWS infrastructure is being used to host production applications developed by other research teams funded by DAIT without the funding to support a federal system. ImmuneSpace is the first example of this usage of ImmPort resources.
2.1. DATABASE ARCHITECTURE

2.1.1. OVERVIEW

Currently ImmPort has 3 databases instantiated in the production environment, 2 use Aurora MySQL databases, and the third (Ontology) uses a local MySQL installed on an Ubuntu server. The plan is to move the Ontology database to the Aurora MySQL in the next year.

1. Shared_Data - read-only, data that has been shared to the public
2. Metric - read/write metric from the various applications is logged to this database
3. Ontology - read-only, contains data to support the Cell Ontology browser

2.1.2. Shared Data

The Shared_Data database contains all the data shared for public access as part of the Data Release process. The Data Release process occurs approximately 4 to 6 times per year. Between releases data remains static and accessed primarily using read-only api. With each release we create a new database, named DRXX_SHARED_DATA, and at the time of the Data Release the connection string for the applications are updated to use the new version of the Shared_Data database.

2.1.2.1. Administrative

This diagram represents the tables used to capture Program and Contract information. Several contracts can be linked to one Program and one or more studies can be linked to each contract.
2.1.2.2. Study

This diagram represents information for the overall design of the study. The `arm_or_cohort` table is used to link studies to subjects using the `arm_2_subject` table. The `study_file` table is used to link various types of files, uploaded by data providers, where the file contents may or may not be structured. Examples of file types uploaded are Case Report forms, generic study data, lab results, assessments, etc. Some of these files may be parsed and loaded into tables like assessment/assessment_component and lab_test_panel/lab_test. Assay result files are not normally loaded into the `study_file` table but are stored in the `file_info` table and usually associated to a `expsample` record. The `study_2_condition_or_disease` table supports associating one or more conditions/diseases to a study. The terms for the conditions/diseases are in the `lk_disease` table, that uses the Disease Ontology and Human Phenotype Ontology, as the source for the terms. The `study_categorization` table provides a method to link a study to broad research focus areas. Examples of research focus areas are: Immune Response, Vaccine Response, Transplantation, etc.
2.1.2.3. Subject

These tables contain subject level information. A subject may be linked to one or more studies via the arm_2_subject table. The arm_2_subject allows the data model to capture the age of the subject at the time of each study. This is important when individual studies are part of a larger longitudinal study and the time frame can span several years. The biosample table represents the material obtained from the subject at a specific point in time. For example if the protocol called for obtaining a blood sample on Day1, Day 7 and Day28, there would be 3 biosample records for each subject.
2.1.2.4. Assessment

Individual assessment_component records can be grouped together as a unit, using the assessment_panel record. For example, an assessment_panel record may represent a questionnaire filled out by a subject, and each of the 20 questions on the questionnaire are represented by 20 assessment_component records. Subject records are linked directly to assessment_component records, which is different from biosample records which are linked to lab_test records. The reason subject records are linked directly to an assessment is an assessment can occur without a biological specimen being collected, for example when filling out a questionnaire. Assessment_component records are linked to a planned_visit record, and the planned_visit record captures the temporal aspects of when the assessments were made.
2.1.2.5. Lab Test

Individual `lab_test` records can be grouped as a unit using the `lab_test_panel` record. For example, a `lab_test_panel` record may represent a group of chemistry tests made on a single blood sample and each of the 10 tests that make up the chemistry test panel are represented by 10 `lab_test` records.

`Biosample` records are linked directly to `lab_test` records. The `biosample` records are also linked to a `planned_visit` record, and the `planned_visit` record captures the temporal aspects of when the `biosample` obtained and when lab tests were performed.
2.1.2.6. Experiment

The experiment table represents assays performed using multiple expsample records. Types of assay methods (measurement_technique) are: ELISA, ELISPOT, PCR, Flow Cytometry, etc. The expsample record is obtained from the biosample record, in some experiments the original biosample may have been divided into multiple expsamples, with each expsample used for a different assay method. If the original assay result file has been uploaded by the data provider, the expsample record is linked to the record in the file_info table, via the expsample_2_file_info table.

2.1.2.7. Assay Results

For common assay methods where result formats are fairly standardized the results are parsed into the result table for that assay method if supplied by the data provider. In the Shared_Data schema, when this information is extracted from the production operational database, several properties are denormalized into these tables to make them easier to use in downstream analysis. In the production database the base table normally has only the experiment_accession and expsample_accession.
2.1.2.8. Lookup Tables - Part 1

There are approximately 45 tables in the Shared_Data schema that ImmPort identifies as lookup tables, but others may refer to them as controlled vocabulary tables. These tables are used to harmonize data from study to study. For many of the base tables ImmPort has both a reported_name and a preferred_name with the preferred name mapped to one of the lookup tables. In addition, several lookup tables are populated using terms from ontologies. Examples of the ontologies used are:

1. Vaccine Ontology
2. Disease Ontology
3. Human Phenotype Ontology
4. Uberon Anatomy Ontology
5. Clinical Measurement Ontology
6. Cell Ontology
7. Protein Ontology
8. Gene Ontology
9. IPD-IMGT/HLA
10. NCBI Taxonomy
11. Ontology Biomedical Investigation

2.1.3. Metric

2.1.3.1. Metric

The three tables in this database represent information parsed from the cl.obo file. The cell_term table captures base information for all cell terms. The cell_synonym table contains names used for a cell term. The information in cell_term and cell_synonym are merged and the content is indexed using ElasticSearch to support the search capability in the application and is displayed in cell detail pop ups on hover in the application. The cell_graph table supports the generation of the force-directed graph displayed in the application which shows the relationship between cell terms.

2.1.4. Cell Ontology

The three tables in this database represent information parsed from the cl.obo file. The cell_term table captures base information for all cell terms. The cell_synonym table contains names used for a cell term. The information in cell_term and cell_synonym are merged and the content is indexed using ElasticSearch to support the search capability in the application and is displayed in cell detail pop ups on hover in the application. The cell_graph table supports the generation of the force-directed graph displayed in the application which shows the relationship between cell terms.
2.2. HOSTED APPLICATIONS

2.2.1. ImmPort Shared Data

ImmPort Shared Data is the application utilized by researchers to identify studies of interest for further exploration and analysis. As of December 31, 2020, 462 studies have been shared and cataloged in ImmPort Shared Data. Currently no row-level results are viewable from within ImmPort Shared Data with the advantage that no user authorization is required. Viewing row-level data would require authorization/user login. ImmPort Shared Data utilizes a standard suite of Linux-based AWS servers and components described below and a Spring/Java and Angular web application architecture.

2.2.1.1. Feature Summary

Table 2.4.1.1-1 below summarizes the major functionality of ImmPort Shared Data.

<table>
<thead>
<tr>
<th>#</th>
<th>Capabilities/Features</th>
<th>Capability/Feature Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Search for Studies</td>
<td>Allows users to perform a “Google like” search to identify shared studies of interest. Text entered by the user is searched against an index of the entire set of metadata stored in the ImmPort database.</td>
</tr>
<tr>
<td>2</td>
<td>View/Filter Query Results</td>
<td>After initial search, users are presented with a list of studies, summary information about each study, and the search hits. From here users may use facets on the left hand panel to further filter studies returned by categories of data such as assay method, species, sample type, etc.</td>
</tr>
<tr>
<td>3</td>
<td>View Study Details</td>
<td>Once a study of interest is identified, users are able to view extensive metadata and summary data about the study.</td>

<td>For a given study, users can click to download the raw study data and are redirected to login to the Data Browser application at NIAID.</td>
</tr>
<tr>
<td>6</td>
<td>View Reference and Static content</td>
<td>Static content such as tutorials, curated cytokine lists, system documentation, user documentation and ImmPort project information are hosted on the ImmPort Shared Data site.</td>
</tr>
</tbody>
</table>
2.2.1.1. Feature 1: Home Page

The ImmPort Shared Data home page provides the entry-point into ImmPort Shared Data. Beyond being an information page containing announcements and ImmPort background information, users can right away begin searching and filtering for studies of interest. In addition, studies that may be of interest to the user community are highlighted in the slider bar based on factors such as recent publications, the popularity of the study based on views or downloads, and recent additions to the shared ImmPort content.
2.2.1.1.2. Feature 2: Search Bar and Results

Once the user has selected to view either all or a subset of studies a list of studies is presented as shown below. The page layout is a familiar design with faceted search capabilities illustrated in the left-hand panel, and a “Google-like” simple text search bar at the top. From this page users may either select a study to view more details, filter the study list further based on facets, click to view a larger version of the study schematic graphic, or click to download the study data. Clicking the Download button directs the user to the Data Browser application in the directory for that study after authentication.
2.2.1.1.3. Feature 3: Study Detail Page

When a study is selected, the user is presented with a study detail page. Within this page there are multiple tabs presented with different aspects of study data based on what has been provided. The full set of tabs that may be displayed include:

- **Summary**: title, description, PI, type, arms/cohorts, study schematic
- **Study Design**: study timeline, inclusion and exclusion criteria, schedule of events
- **Adverse Event**: summary of adverse event data by severity, name, arm
- **Assessment**: summary of assessments taken
- **Interventions**: summary of interventions performed
- **Medications**: concomitant medications taken
- **Demographics**: summary information about gender, age, ethnicity
- **Lab Tests**: summary of laboratory panels and tests
- **Mechanistic Assays**: summary of assays performed, protocols, platforms, reagents, treatments
- **Study Files**: catalog of study data files provided

<tr>
<td>Detailed Description</td>
<td>Immune responses in diverse tissue sites are critical for protective immunity and homeostasis. Here, we investigated how tissue localization regulates the development and function of human Natural Killer (NK) cells, innate lymphocytes important for anti-viral and tumor immunity. Integrating high-dimensional analysis of NK cells from blood, lymphoid organs, and mucosal tissue sites from 59 individuals, we identify tissue-specific patterns of NK cell subset distribution, maturation and function across age and between diverse individuals. Mature and terminally differentiated NK cells with enhanced effector function predominate in blood, bone marrow, spleen and lungs, exhibiting shared transcriptional programs across sites. By contrast, precursor and immature NK cells with reduced effector capacity prevail in lymph nodes and intestines, exhibiting tissue-resident signatures and site-specific adaptations. Together, our results reveal anatomic control of NK cell development and maintenance as tissue-resident populations, while mature, terminally differentiated subsets mediate immunosurveillance through diverse peripheral sites.</td>
</tr>
<tr>
<td>Objectives</td>
<td>Characterize tissue-specific compartmentalization and functional properties of NK cells</td>

2.2.1.2. Hardware and Software Architecture Components

Table 2.4.1.2-1 below describes the hardware components and software components that constitute the architecture of ImmPort Shared Data.

Table 2.4.1.2-1: Hardware and Software Architecture Components

<table>
<thead>
<tr>
<th>Component Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JavaScript Object Notation (JSON)</td>
<td>A lightweight, human-readable data-interchange format widely used in web applications and web-based API's.</td>
</tr>
<tr>
<td>Spring Boot</td>
<td>Provides a ready to start Spring-based application deployment that utilizes best practices for the configuration (<a href="http://projects.spring.io/spring-boot/">http://projects.spring.io/spring-boot/</a>)</td>
</tr>
<tr>
<td>Spring Web MVC</td>
<td>Provides model-view-controller architecture (MVC) and components to develop flexible and loosely coupled web applications in the Spring family of components</td>
</tr>
<tr>
<td>AWS Aurora</td>
<td>A widely used open source relational database system now owned by Oracle corporation. <a href="http://www.mysql.com">www.mysql.com</a></td>
</tr>
<tr>
<td>Angular 8+</td>
<td>A popular environment with interactive components for developing dynamic web-based applications using AJAX/JavaScript developed by Google but open source. <a href="https://angularjs.org">https://angularjs.org</a></td>
</tr>
<tr>
<td>AWS ElasticSearch</td>
<td>Popular open source enterprise search platform built on Apache Lucene™ utilizing Apache Tomcat as the servlet container (lucene.apache.org)</td>
</tr>
<tr>
<td>Google Analytics</td>
<td>Web monitoring tool framework provided by Google.</td>
</tr>
<tr>
<td>Amazon Web Services (AWS)</td>
<td>Amazon Web Services (AWS) provides cloud infrastructure and a wide array of server capabilities for developers to build production applications. (aws.amazon.com)</td>
</tr>
<tr>
<td>Elastic Compute Cloud (EC2)</td>
<td>Amazon Elastic Compute Cloud (Amazon EC2) is a web service that provides resizable compute capacity in the cloud, designed to make development easier through ease of server creation, duplication, and shutdown along with providing a suite of configuration options for hardware and software/OS specifications.</td>
</tr>
<tr>
<td>Virtual Private Cloud (VPC)</td>
<td>Allows administrators to provision a logically isolated section of the AWS cloud where AWS resources can be created and launched in a customized virtual network</td>
</tr>
<tr>
<td>Simple Storage Service (S3)</td>
<td>Provides secure, durable, highly-scalable cloud storage.</td>
</tr>
<tr>
<td>Relational Database Service (RDS)</td>
<td>Provides pre-configured database servers for Oracle, SQL Server, PostgreSQL, MySQL and MariaDB where AWS performs the database administration allowing the development team to focus energies on application specific details and development.</td>
</tr>
</tbody>
</table>

2.2.1.3. Data Architecture

Data used by the ImmPort Shared Data application is stored and retrieved using multiple technologies. Primarily data is stored in an AWS Aurora MySQL database. The Shared Data schema maps closely to the Oracle production operational database but has been partly de-normalized to optimize query performance and to support the Data Query API. The database contains all information for all studies shared for public access.

An AWS ElasticSearch index is used to support free text and faceted searching of study information and to support site search. The content indexed is updated with each quarterly release. ImmPort also uses AWS S3 buckets to host content generated as part of the Data Release process and remains static for each release.
An overview of the ImmPort Shared Data model is available on the web site on the **Data Model** page. The table and column documentation is available on the web site on the **Relational Database** page.
2.2.1.4. ImmPort Shared Data Server Architecture

ImmPort Shared Data, on AWS, is separated into its own private network or VPC. The outward-facing Tomcat web server is contained in a public subnet where the site www.immport.org is directed while data servers are contained in a private subnet only available through the NAT EC2 server within the public subnet. This separation limits exposure to security threats in the data tier of ImmPort Shared Data. The configuration follows the AWS recommendations described at http://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_Scenario2.html
2.2.1.5. ImmPort Shared Data Software Architecture

ImmPort Shared Data is a standard Java Spring based web application. The client layer utilizes JavaScript AJAX frameworks such as JQuery and Angular to provide interactive graphical user interfaces. The Model, View and Controller uses Spring Web MVC with Tiles/JSP to layout the web pages. Hibernate provides the data and persistence layer to the MySQL relational database via JDBC. Queries against SOLR are run through the web service connecting to the SOLR Tomcat server.
2.2.2. Study Search

2.2.2.1. Fields
When a word is entered in the study search box. The following fields are searched:

- study_accession
- study_accession.ngram
- brief_title
- brief_title.ngram
- brief_description
- brief_description.ngram
- description
- description.ngram
- doi
- doi.ngram
- endpoints
- endpoints.ngram
- hypothesis
- hypothesis.ngram
- objectives
- objectives.ngram
- official_title
- official_title.ngram
- sponsoring_organization
- sponsoring_organization.ngram
- research_focus
- arm_or_cohort_all
- arm_or_cohort_all.ngram
- biosample.type
- contract_grant.name
- contract_grant.name.ngram
- contract_grant.external_id
- program.program_name
- program.program_name.ngram
- condition_preferred
- condition_preferred.ngram
- condition_reported
- condition_reported.ngram
- experiment_all.ngram
- pubmed_all.ngram
- personnel_all.ngram
- elisa_result_all.ngram
- elispot_result_all.ngram
- fcs_analyzed_result_all.ngram
- hai_result_all.ngram
- hla_typing_result_all.ngram
- kir_typing_result_all.ngram
2.2.2.1. Aggregated Fields

The fields ending with “_all” is a collection of the data of all the fields in that category. For example pcr_result_all is the data from the following fields:

- pcr_result.gene_id
- pcr_result.gene_name
- pcr_result.gene_symbol_preferred

2.2.2.2. Boosting

Individual fields can be boosted with the caret (^) notation. Matches on the study_accession (boost : 200), brief_title (boost : 150), brief_description (boost : 100), official_title (boost : 75) have more relevance than the other fields since their boost factor is more. Example: If you search for the word “Monoclonal”,

<table>
<thead>
<tr>
<th>Study</th>
<th>Title</th>
<th>Pubmed Id</th>
<th>Research Focus</th>
<th>Latest Release Version</th>
<th>Latest Release Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>SDY1</td>
<td>Efficacy and Safety Evaluation of Allergen Immunotherapy Co-Administered with Omalizumab (an anti-EG Monoclonal Antibody) (ITN019AD)</td>
<td>16387596 17531952</td>
<td>Acute/Allergy</td>
<td>DR21</td>
<td>2017-04-21</td>
</tr>
<tr>
<td>SDY524</td>
<td>AbATE ITN027AI: Autoinnunity-blocking Antibody for Tolerance in Recently Diagnosed Type 1 Diabetes</td>
<td>2383533 22664195</td>
<td>Autoimmune</td>
<td>DR19</td>
<td>2016-06-17</td>
</tr>
<tr>
<td>SDY901</td>
<td>Use of Rituximab for Sjogren's Syndrome (ASJ01)</td>
<td>23334994</td>
<td>Autoimmune</td>
<td>DR22</td>
<td>2017-06-16</td>
</tr>
<tr>
<td>SDY416</td>
<td>Study to measure the immune response to the influenza vaccine in patients with chronic plaque psoriasis</td>
<td></td>
<td>Vaccine Response</td>
<td>DR18</td>
<td>2016-08-08</td>
</tr>
<tr>
<td>SDY1544</td>
<td>LEA29Y (Belapectant) Emory Edmonton Protocol (LEEP) (CIT-04) and Extended Follow Up after Islet Transplantation in Type 1 Diabetes (CIT-08)</td>
<td></td>
<td>Transplantation</td>
<td>DR33</td>
<td>2020-01-29</td>
</tr>
</tbody>
</table>

- Analysis of the repertoire and monoclonal antibodies from plasmablasts in a subset of vaccines
SDY1 gets the highest score because the word “Monoclonal” was found in brief_title (150) and official_title (75) both having a high boost value.
SDY524 - has second highest score since the word “Monoclonal” was found in brief_description (100)
SDY1544 and SDY56 come later since Objectives (50) and EndPoints (50) have lower boost values

2.2.2.3. Ngram search:

Ngrams helps to search whether a term belongs to a word fully or partially. For example, if you search for “microbial”

SDY148 - anti-microbial (partial)
SDY1162 - microbial (full)
SDY857 - antimicrobial (partial)

2.2.2.4. Phrase search

If a phrase is searched without the double quotes then the results will use the best_fields type search. The best_fields type is most useful when you are searching for multiple words best found in the same field. For instance “brown fox” in a single field as a phrase is more meaningful than “brown” in one field and “fox” in the other and “brown” and “fox” separated by other words in a single field. For example if phrase is ‘clinical islet transplantation’, 170 studies were found since first the studies with the phrase is found and then individual words are searched
SDY1432 came up first since clinical islet transplantation was found in brief title (boost value 150)
SDY1544 came up ninth since clinical islet transplantation was found in contract grant name (boost value 5)
SDY960 came up 10th since the phrase was tokenize by space. And the tokenized words were found in fields. For example if the phrase is ‘Ad35.CS.01’ is tokenized and then searched.

If a phrase is searched with the double quotes then the results will use the phrase_prefix type search. The whole phrase will be found in the fields For example, if the phrase is “clinical islet transplantation”, 8 studies were found. If “Ad35.CS.01” is searched with double quotes only one study shows else 18

2.2.3. ImmPort Data Query API

The Data Query API provides programmatic access to ImmPort Shared Data. This API works as a query tool to access ImmPort descriptive data (metadata) and interpreted results for assays such as ELISA, ELISPOT, MBAA (Luminex), HAI, Neutralizing Antibody Titers, HLA and KIR typing, QPCR, flow and mass cytometry based on various input filter parameters. The API returns a JSON output by default. A tab separated output can also be returned if format=tsv is passed as a parameter to the specified endpoint. The HTTP method supported by this API is GET for this version of this API.

Data Query API endpoints can be accessed directly by a user or by an application. The ImmPort Shared Data application uses some of the endpoints to get data for the search and study detail pages. All requests to the Data Query API require authentication and the Data Query API uses tokens for authentication. Users can obtain tokens by posting to the ImmPort Authentication URL- https://auth.immport.org/auth/token with their username and password. They must include the authentication token as an Authorization: bearer in the custom HTTP header.

2.2.3.1. Feature Summary

This link documents the endpoints of the API https://docs.immport.org/#API/DataQueryAPI/dataqueryapi/
2.2.3.2. ImmPort Data Query API Server Architecture

The ImmPort Data Query API is hosted in AWS on an EC2 instance in the public subnet. The data servers are contained in a private subnet only available through the NAT EC2 server within the public subnet. This separation limits exposure to security threats in the data tier of ImmPort Data Query API. The configuration follows the AWS recommendations described at [http://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_Scenario2.html](http://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_Scenario2.html)
2.2.3.3. ImmPort Data Query API Software Architecture

ImmPort Data Query API is a Spring Boot application using Spring JPA which makes it easier to build Spring-powered applications that use data access technologies. It also exposes a study search endpoint that calls a method on the service layer. The service layer builds the elastic search queries based on the parameters sent to the endpoint and then queries AWS ElasticSearch service that has a study index which contains study json files. The Model, Repository and Service Layers are different java applications. The API layer depends on these applications and packages them during the build process into a single jar file.
2.2.4. ImmPort Data Browser

The Data Browser is a web-based application with use of similar web frameworks as ImmPort Shared Data described previously. The interactive UI is handled by Angular components using AJAX and JavaScript, while the MVC architecture is implemented in Spring. Aspera Security is utilized when calls are made to download content on the data files and directories identified in the Aspera Node Server. The Aspera Connect Server governs interactions with the data files and directories via the Aspera Connect Client.

2.2.4.1. Feature Summary

Table 2.4.4.1-1 below summarizes the major functionality of ImmPort Data Browser.

<table>
<thead>
<tr>
<th>#</th>
<th>Capabilities/Features</th>
<th>Capability/Feature Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Browse Study Files</td>
<td>Allows users to browse the shared data study files and packages that are available to download in the current data release</td>
</tr>
<tr>
<td>2</td>
<td>Download Study Files/Packages</td>
<td>Allows users to select and download study files packages from the latest data release.</td>
</tr>
<tr>
<td>3</td>
<td>Download archive</td>
<td>Allows users to download study files from the older versions that are moved into archives directory.</td>
</tr>
</tbody>
</table>
2.2.4.1.1. Feature 1: Home Page

The Data Browser home page provides a list of studies and files available to download in the latest data release. Users can browse through the list of studies and can select a study directory or pick files across studies to download.
2.2.4.1.2. Feature 2: Study Drill down

Users can drill down into each study to select individual files and packages to download. An example snapshot of data available in each study is below.

Example: SDYxx-DRxx_MySQL.zip is a MySQL dump of the study SDYxx in data release DRxx
Similarly, tab separated files packaged as a zip file are available to download for each study.
Each study has an archive directory where previous versions of the study can be found. If a user is looking for a study in particular data release it can be found in the archives directory.
2.2.4.1.3. Feature 3: Aspera Connect Download

The ImmPort data browser allows users to download ImmPort data by individual file, directory, or study. The data browser uses a software tool called Aspera Connect to transfer files from ImmPort to users. This software works with the user’s internet browser to quickly and securely transfer files. Aspera Connect requires data downloaders to install the Aspera Connect Client Plugin onto their computer where the files will be downloaded. The Aspera Connect plugin can be downloaded directly through the ImmPort data browser. Here are the instructions for the Aspera Connect Installation [https://www.immport.org/installAsperaHelp](https://www.immport.org/installAsperaHelp)

Alternatively, the installation files and documentation for the plugin can also be found here [http://downloads.asperasoft.com/connect2/](http://downloads.asperasoft.com/connect2/)

2.2.4.2. ImmPort Data Browser Architecture
2.2.5. ImmPort Data API

The ImmPort Data API is used by the ImmPort Data Browser to browse and download ImmPort shared data on the Aspera Production Server at NIAID. It is also used by ImmPort users who wish to programmatically browse and download ImmPort shared data after obtaining an ImmPort token.

ImmPort Data API allows users to browse and download files and directories on an Aspera Server and to create content listing files for these files and directories (all via POST requests only). ImmPort Data API endpoints are protected and require an ImmPort token to access. ImmPort Data Api fetches an Aspera token internally to talk to the Aspera Server to download the files.

2.2.5.1. Feature Summary

Following are the endpoints available in ImmPort Data API

https://api.immport.org/data/content/listing/information
gets the name of the content listing directory and the start and end times of the content listing file generation.

https://api.immport.org/data/content/listing/creation
creates files containing the content listings sorted alphabetically, by size, and by last modification date in both ascending and descending order for each directory.

https://api.immport.org/data/content/listing/report
Returns a a JSON report of the content listing creation

https://api.immport.org/data/list
takes a list of files and directories and downloads them from the aspera server as a zip package.

https://api.immport.org/data/download/token
Returns an aspera download token

https://api.immport.org/data/download/specification
Returns an aspera download specification

2.2.5.2. ImmPort Data API Server Architecture

The ImmPort Data API is hosted on an EC2 instance in the public subnet on AWS. The Aspera server is hosted on the NIAID On-premises infrastructure.
2.2.5.3. ImmPort Data Query API Software Architecture

ImmPort Data API is a Spring Boot application with a service layer containing a Content Service for listing and downloading ImmPort shared data using the Aspera Node API.
2.2.6. ImmPort Portal

ImmPort Portal is a static web application that hosts all static web pages required across ImmPort web applications.

2.2.6.1. Feature Summary

Table 2.4.6.1-1 below summarizes the major functionality of ImmPort Data Browser.

<table>
<thead>
<tr>
<th>#</th>
<th>Capabilities/Features</th>
<th>Capability/Feature Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Static pages</td>
<td>All static web pages required across all ImmPort applications Ex: Home page, user agreement page, aspera installation instructions etc.,</td>
</tr>
<tr>
<td>2</td>
<td>ImmPort Tutorials</td>
<td>Hosts several ImmPort tutorials and the instructions to use them</td>
</tr>
<tr>
<td>3</td>
<td>ImmPort Documentation</td>
<td>Data Upload and templates documentation</td>
</tr>
</tbody>
</table>
2.2.6.1.1. Feature 1: Home Page

The ImmPort home page is the landing page of the ImmPort Ecosystem and hosts several links to various ImmPort applications.
2.2.6.1.2. Feature 2: User agreement

ImmPort is a data sharing and data analysis portal for the immunology research community funded by the National Institute of Allergy and Infectious Diseases (NIAID), Division of Allergy, Immunology, and Transplantation (DAIT). Users will be asked to accept the terms and conditions of this agreement without exception when you log in to ImmPort.

User Agreement for the NIAID Immunology Database and Analysis Portal (ImmPort)

1.1 You will not attempt to identify individuals from ImmPort data sets

As a condition of obtaining access to the ImmPort database you agree to not use the ImmPort data, alone or in combination with other data, to identify any individual or entity or otherwise link information from these data with information in another dataset in a manner that includes the identity of an individual or entity. If you inadvertently discover the identity of any patient, then (a) you agree that you will make no use of this knowledge, (b) that you will notify the NIAID Program Officer (Quan Chen, quan.chen@nih.gov) of the incident, and (c) that you will inform no one else of the discovered identity.

1.2 Do not share your username and password

You will use reasonable efforts to maintain the secrecy of the user name issued to you by ImmPort and the password corresponding to the user name. Without limiting the foregoing, you will not share password or user name information with others or allow others to use your password and/or user name.

1.3 Data Provider Obligations

If errors with provided data are identified at a later date, the Data Provider agrees to update uploaded data for accuracy.

Warranties and Liability

2.1 Data available at ImmPort are provided on an “AS IS” basis.

NIAID, Northrop Grumman, and Data Provider make no representations with respect to Data. DATA ARE PROVIDED TO YOU WITH NO WARRANTIES, EXPRESS OR IMPLIED, INCLUDING: WARRANTIES OF MERCHANTABILITY; WARRANTIES OF FITNESS FOR A PARTICULAR PURPOSE; WARRANTIES OF IDENTITY, OWNERSHIP, QUALITY, ACCURACY, OR COMPLETENESS OF DATA; OR WARRANTIES THAT THE USE OF DATA WILL NOT INFRINGE ANY PATENT, INTELLECTUAL PROPERTY, OR PROPRIETARY RIGHTS OF ANY PARTY.

2.2.6.1.3. Feature 2: Resources Page

ImmPort Portal also hosts links to several ImmPort resources like ImmuneXpresso, Cell Ontology, ImmuneSpace, 10K Immunome etc.,
2.2.7. ImmPort S3 API

ImmPort S3 API is an Amazon API Gateway fully managed by AWS. It is a RESTful API created to read and write to the JSON files stored on the AWS S3 buckets. The purpose of this API is to push updates to ImmPort web pages outside their build cycles. For example, ImmPort announcements on the Shared Data home page are stored in a JSON file on the S3 bucket, a new announcement will require only a JSON file update on the S3 bucket instead of a complete build cycle of the software. AWS Lambda is employed for some of the endpoints to do any data processing that is needed prior to returning the data to the user.

2.2.7.1. Feature Summary

Following are the endpoints available in ImmPort S3 API accessible at the URL https://s3.immport.org/
2.2.7.2. ImmPort S3 API Server Architecture

The ImmPort Data API is hosted on an EC2 instance in the public subnet on AWS. The Aspera server is hosted on the NIAID On-premises infrastructure.

2.2.8. ImmPort CloudFront Distributions

ImmPort configures amazon CloudFront distributions to server HTTPS requests for the following two ImmPort S3 buckets.

1. downloads.dev.immport.org: Used for allowing users to download data upload templates and example packages.
2. docs.immport.org: Used for Static website hosting of API documentation website.

Content is for public use on these S3 buckets.

2.2.9. Authentication of the Rest API - Resource Servers

The Rest API's are OAuth 2.0 Resource Servers built using Spring Security 5. In the context of OAuth 2.0, a resource server is an application that protects resources via OAuth tokens. These tokens are issued by an authorization server, typically to a client application. The job of the resource server is to validate the token before serving a resource to the client. JWT, or JSON Web Token is a way to transfer sensitive information securely in the widely-accepted JSON format. The contained information could be about the user, or about the token itself, such as its expiry and issuer. To visualize, let's look at a sequence diagram for the authorization code flow and see all the actors in action:
2.2.10. Cell Ontology Browser

The Cell ontology browser was developed to support the visualization of the Cell Ontology (http://obofoundry.org/ontology/cl.html), which is of great utility in the curation of ImmPort data for the standardization of cell populations. The browser provides a force directed graph visualization of the ontology, and utilizes the same software stack (Angular, ElasticSearch, MySQL) as other ImmPort applications, to allow for searching for Cell Ontology terms with the addition of D3 for the visualization component. The content is updated as part of the ImmPort data release process.
2.2.10.1. Cell Ontology Browser Architecture
2.2.11. ImmuneXpresso

The ImmuneXpresso application was built under the BISC Contract Option 7 in years 2014-2015 and developed in collaboration with the team at the Shen-Orr lab at Technion (http://shenorrlab.technion.ac.il/). ImmuneXpresso continues the work of the Shen-Orr lab in mining PubMed abstracts to determine relationships between cells and cytokines. The primary content is stored on a standalone EC2 hosting a MySQL database and accessible via a RESTful API. This EC2 instance is maintained by the Shen-Orr lab, and a black box to the ImmPort team. The front-end technology follows the same design pattern as most single page applications but was written before frameworks like React and Angular were available. The code base is 5 years old and not updated to use the Angular framework like other ImmPort applications. ImmuneXpresso term queries are supported by SOLR indexing of cell and cytokine terms.
2.2.11.1. ImmuneXpresso Architecture

2.2.12. Galaxy

The original ImmPort Open application provided support for flow cytometry analysis primarily using the FLOCK (FLOw Clustering without K) algorithm. During the current contract we have chosen to utilize the popular analysis workflow engine Galaxy (https://galaxyproject.org/) to optimize modular method and component development and eventual sharing of data and workflows. The use of a publicly available web analysis framework was chosen over
direct replacement of existing code in ImmPort because of the existence of open source tools that largely perform the workflow capabilities of queuing, bursting, and chaining methods in a generic way and to reduce cost to the ImmPort development team when developing and maintaining code to perform those workflow capabilities.

Galaxy is an open, web-based platform for accessible, reproducible, and transparent computational research. The ImmPort Galaxy platform is focused on providing tools for flow cytometry analysis. In addition to implementing many R/BioConductor packages for flow cytometry analysis, the ImmPort team has written several modules to aid in visualization of the results. Below are a list of some of the tools available in the ImmPort Galaxy application:

- Clustergrammer
- Flock version 2 and 3
- flowAI
- flowCL
- flowDensity
- flowStats
- flowViz
- FlowSOM
- MetaCyto

The ImmPort Galaxy instance is hosted on an AWS EC instance and uses additional volumes to host the Galaxy file system and an Aurora PostgreSQL instance to support the Galaxy database.
2.2.13. ImmuneSpace

ImmuneSpace, available at www.immunespace.org, was developed by the team at the Gottardo lab (http://www.rglab.org) at Fred Hutchinson Cancer Center with the team at Labkey Software (www.labkey.com) under funding of the Human Immunology Project Consortium (www.immuneprofiling.org). Details about the project are available at the ImmuneSpace site and the architecture in the Labkey product pages. The ImmPort team provides hosting and basic IT services on AWS for ImmuneSpace in the AWS instances funded by NIAID/DAIT.

2.2.14. Metrics

Elasticsearch and Kibana (EK) Stack on AWS are used for storing, searching and visualizing log and metric data. This allows for better searches and creates more analytical graphs for usage metrics. An Elasticsearch, Fluentd, and Kibana (EFK) Stack was initially considered but we decided on the Elasticsearch, Metric Rest API, Kafka, Aurora Mysql stack.

2.2.14.1. Common data model for Metrics

- A common json format was devised after looking at the various data elements of each of the different applications so that it can be easily searched and visualized. The common format that was formulated was as follows:

```json
{
  // common parameters
  "metricId": "",
```
"metricType": "",
"username": "",
"remotelpAddress": "",
"organization": "",
"applicationName": "",
"endPoint": "",
"startTime": "",
"ngUser": "",
"dateCreated": "",
"createdBy": "",

### The parameters field is an object of data elements for the different applications. The different applications will fill in the appropriate fields.

"parameters": {
    "searchTerm": "", parameter for ImmPort shared data
    "clinical": "Y",
    ...
    "fileName": "" parameters for ImmPort Data Browser
    "fileSize": "",
    ...
    "parentLevel": "", parameters for ImmPort Ontology
    "relationshipType": "",
    ...
    "ageEvent": "", parameters for ImmPort Data Query API
    "expsampleAccession": "",
    ...
    }
    }

- Historic metric data currently stored in CORE_IMMPORT was copied to the Metric Database on AWS Aurora
- The current and historic data in the Metric Database on AWS Aurora was cleaned, validated and transformed to the new format and stored in a new table in AWS Aurora MySQL database called metric_log which conforms to the new format.
- Data from this table was extracted as json files and then sent to ElasticSearch.
2.2.14.2. Metrics Software Architecture

- REST has quickly become the de-facto standard for building web services because they're easy to build and consume. We built a Rest API to collect metrics from all ImmPort Applications so we have a central application to collect metrics.
- The Metric Rest API endpoints require an authentication token for access. ImmPort Applications call the writeMetric endpoint on the Metric Rest API which takes a metric object.
- The Metric API asynchronously sends the metric object to the Kafka messaging queue. This enables ImmPort Applications to log the metric and immediately return. The method in the ImmPort Applications to call the metric endpoint is also asynchronous. At no point will the ImmPort Applications be blocked due to logging.
- The Metric API is also a listener to the Kafka messaging queue. As soon as the queue receives a metric object the listener calls the saveMetric endpoint to save the metric to the database.
- A cron job runs every 1 minute to check whether a new metric is saved to the database. If there are metrics these rows are converted to a json object and sent to Elastic search

2.2.14.3. Visualizations in Kibana

Searching the metric logs and creating usage visualizations becomes easy since the data is stored in Elasticsearch

2.2.14.3.1. Example of the Discovery tab
ImmPort Data Browser and ImmPort Data Api usage
The figure above shows some of the fields of metrics collected for the data browser and data api, e.g., username, organization, endPoint, study accession. Other fields that can be shown are filename, file count, file size, application name, remote ip address of the user etc.

2.2.14.3.2. Example of the Visualization tab:

The above figure shows the top ten studies downloaded for the month of September. Various types of visualizations and data can be aggregated in the ElasticSearch and Kibana stack.
2.2.15. Utilization Report

We have automated the Monthly ImmPort Utilization Report using Jupyter Notebook. A predefined Jinga template has been created and the notebook populates the template with the specifics for that report.

The monthly information is currently pulled from either:

- The ImmPort Core Query API
- AWS Elasticsearch
- S3 bucket
- ImmPort Galaxy Postgres
- Google Analytics API

2.3. Data Release

The ImmPort team currently produces 4 to 6 data releases per year. With each release additional studies are made publicly available as well as updates made to previously existing shared studies. The process involves using computers, data in file systems and an Oracle database in the NIAID OCICB environment, as well as an AWS Aurora MySQL instance, S3 buckets, and software in the ImmPort AWS environment. The current contract mandates the production database and data uploaded to ImmPort be hosted in the NIAID OCICB facility.

2.3.1. Overview of OCICB Components and Process
Steps to perform a data release are depicted above and outlined below. In this section we focus on how Study packages, including the ALLSTUDIES package, are created as part of the data release process. We will not discuss the initial step, executed by the Data Curation team, that identifies which studies are ready for public data sharing.

1. Create a DOI using the DataCite platform for new shared studies. New DOIs are uploaded to the production database.
2. A Python process is run to construct the ALLSTUDIES package that includes all shared studies bundled into a package suitable for loading into a MySQL database. The process runs on the Linux server and executes code to extract information from the Oracle database which is used to create the ALLSTUDIES package. The files created by this process are placed in the Staging file system.

3. The ALLSTUDIES package is used to populate a local MySQL database. This process ensures data extracted matches the data we expect to be extracted for the data release. QC steps run scripts to measure whether table row counts have increased from the previous release to the current release. Another script checks whether the table structure of the previous data release matches the table structure of the current release, etc. The primary QC check occurs when foreign keys are applied for each table as the final step in building the MySQL database. If data has not been extracted properly foreign key violations arise requiring review before the data release process can continue. The ALLSTUDIES package is placed in the Staging file system.

4. Once ALLSTUDIES data have been extracted properly another Python process is executed to extract information from the Oracle database and construct an individual package for each study. During this step result files for the new studies are copied from the Data_Mgt file system to the Shared_Data file system. The study packages are placed in the Staging file system.

5. On the day of the release the current contents for the previous release are moved into their respective archive directory on the Shared_Data file system. New content generated by Step 3 and Step 4 are moved into the base directory on the Shared_Data file system for each study including the ALLSTUDIES package.

6. The Final step is to run the Python process to update the DataBrowser content making the new release files available for public download.
2.3.2. Overview of AWS Components and Process

Steps to perform a data release are depicted above and outlined below. This section focuses on the production database and how files to support UI and ElasticSearch content are generated and deployed for use by API and UI.
1. Several views and materialized tables are created on top of the MySQL Shared_Data database to support the UI and API.
2. When step 1 has completed, the warehouse version of the database is copied and loaded into the DEV and Production MySQL Aurora databases on AWS.
3. The next step is to generate JSON files containing static content for use by the UI, to display graphics, data release notes, and to support indexing by Google for improved search engine optimization.
4. Files generated in step 3 are copied to the development AWS S3 buckets for QC testing then, on the day of the data release, copied to the production AWS S3 buckets.
5. A similar process is used to extract information from the MySQL database to prepare and load this information into ElasticSearch. The development environment is loaded for QC testing and, on the day of the data release, the production environment is loaded and indexed.
6. Another process is run to generate content to support site search which is also indexed using ElasticSearch.

3. ImmPort OCICB

3.1. OVERVIEW

Most ImmPort public facing applications are hosted using AWS infrastructure whereas operational applications and databases are hosted by the Office of Cyber Infrastructure and Computational Biology (OCICB), which manages technologies supporting NIAID biomedical research programs. Since 2011 the OCICB and ImmPort teams have collaborated in the deployment and maintenance of applications in support of ImmPort operational activities.

The OCICB infrastructure supports Production and QA environments. Applications hosted at NIAID are primarily focused on upload, management, QC and curation of private data sets under embargo. This ensures private data sets have the highest level of security and access controls, provided by the NIAID facility during the embargo period, when access to the data needs to be restricted to a limited set of users. When research and clinical data have been curated and released from embargo, and shared with the larger user community, these data continue to be made available to registered users using the Amazon Web Services (AWS) infrastructure.

3.1.1. Feature Summary

<table>
<thead>
<tr>
<th>#</th>
<th>Capabilities/Features</th>
<th>Capability/Feature Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>User Administration</td>
<td>System administration capabilities include allowing users to request system access (register), approve registration requests, create user accounts, update user information, query user information, and deactivate users.</td>
</tr>
<tr>
<td>2</td>
<td>Log In/Off</td>
<td>Authentication and authorization capabilities including allowing users to login, logoff, and retrieve login information when the account or password is forgotten.</td>
</tr>
<tr>
<td>3</td>
<td>Manage NIAID/DAIT Programs</td>
<td>Contract/grant management capabilities including creating, searching, deleting, modifying, and viewing contracts and grants and assigning a PI for a contract or grant.</td>
</tr>
<tr>
<td>4</td>
<td>Manage Research Project (RP) / Private Project Workspace (PPW)</td>
<td>Manage Research Projects (RP) including allowing a user designated as a PI or PM on a grant to create a project and it’s associated RP and update the information associated with the project, manage user access to the RP.</td>
</tr>
<tr>
<td>5</td>
<td>Manage Collaborative Project (CP)</td>
<td>Manage the CP capabilities including allowing a user designated as a PI or PM on a contract or grant to create a CP, update the information associated with the CP, control user access to the CP, and share datasets in a CP.</td>
</tr>
<tr>
<td>6</td>
<td>Data Submission</td>
<td>Batch loading of experimental data into a RP for multiple types of relevant metadata to provide the minimum information for multiple experimental assay types.</td>

<td>UI application to control the release of study information for public distribution</td>
<td></td>
</tr>
<tr>
<td>Database Audit History and Archiving</td>
<td>Maintain a complete audit history of research data (including analysis toolset data created) that is both updated and deleted. The audit history is defined as the ability to capture &quot;who&quot;, &quot;what&quot;, and &quot;when&quot; of the data involved in a change or deletion to Research data contained in the ImmPort System. Additionally, audit and collect limited summary information with respect to auditing/tracking of user session activity on a limited number of database areas. The focus is to obtain summary information on system activity such as logins, information created and updated in the several areas of the Administration Module, and usage of baseline Analysis Tools. Additionally, provide the capability to audit and track user session log information.</td>
<td></td>
</tr>
<tr>
<td>Core Query API</td>
<td>Provides programmatic access to the Core ImmPort Data</td>
<td></td>
</tr>
</tbody>
</table>
3.2. OCICB ARCHITECTURE

Drawing still in progress
3.3. DATABASE ARCHITECTURE

The ImmPort system database architecture is stored and maintained in an Oracle 17g Enterprise Edition database utilizing Real Application Clusters (RAC), installed on a Linux EL7 operating system. Installed database options include Oracle Partitioning, On-Line Analytical Processing (OLAP), and Oracle Data Mining (ODM) options. The RAC environment provides necessary system load distribution and load balancing, while at the same time providing system redundancy and failover capabilities.

In RAC, multiple active instances of the database server on different servers or processors can concurrently execute transactions against a shared database. It allows large tasks to be divided into subtasks and distributed among multiple nodes, which provides great efficiency. RAC automatically handles load balancing by distributing the load on multiple nodes and also supports parallel processing of data on multiple nodes. This becomes critical when handling the heavy processing loads required for many of the ImmPort analysis tools, or the large batch upload data submissions. RAC inherently provides high availability by guaranteeing that the database system is operational as long as one node in the cluster is up, and reliability by providing user transparent transaction fail-over.
### 3.3.1. CORE_IMMPORT

#### 3.3.1.1. Overview

The CORE_IMMPORT database is the primary operational database where all read/write activity occurs. Almost all tables in this database include audit/editorial columns that track: date_created, created_by, data_last_updated and last_updated_by. In addition, the CORE_IMMPORT database is mirrored by the CORE_IMMPORT_HIST database, which tracks edits made to the tables in the CORE_IMMPORT database.

#### 3.3.1.2. Workspace

The workspace tables are important components for the process of releasing private studies to the public. In addition, they are used to control which users have access to individual rows in the database and the workspace_2_user supports access control to a workspace and all the objects linked to that workspace. In the workspace table there is a special workspace with workspace_id equal to zero. When rows from the base tables are released to the public as part of the Data Release sharing process, rows for the objects being released are inserted into the workspace_2_XXX table, with the workspace_id set to zero. This allows the ImmPort Data Release process to use views that make sure only rows in the base tables, linked to the workspace_2_XXX table, are included in the output.

### WORKSPACE 2 ASSESSMENT PANEL
- **WORKSPACE_ID**: NUMBER (38)
- **ASSESSMENT_PANEL_ACCESSION**: VARCHAR2 (15 BYTE)
- **UPLOAD_TICKET_NUMBER**: VARCHAR2 (100 BYTE)
- **DATE_CREATED**: DATE
- **CREATED_BY**: VARCHAR2 (20 BYTE)
- **DATE_LAST_UPDATED**: DATE
- **LAST_UPDATED_BY**: VARCHAR2 (20 BYTE)

### WORKSPACE 2 BIOSAMPLE
- **WORKSPACE_ID**: NUMBER (38)
- **BIOSAMPLE_ACCESSION**: VARCHAR2 (15 BYTE)
- **UPLOAD_TICKET_NUMBER**: VARCHAR2 (100 BYTE)
- **DATE_CREATED**: DATE
- **CREATED_BY**: VARCHAR2 (20 BYTE)
- **DATE_LAST_UPDATED**: DATE
- **LAST_UPDATED_BY**: VARCHAR2 (20 BYTE)

### WORKSPACE 2 CONTROL SAMPLE
- **WORKSPACE_ID**: NUMBER (38)
- **CONTROL_SAMPLE_ACCESSION**: VARCHAR2 (15 BYTE)
- **UPLOAD_TICKET_NUMBER**: VARCHAR2 (100 BYTE)
- **DATE_CREATED**: DATE
- **CREATED_BY**: VARCHAR2 (20 BYTE)
- **DATE_LAST_UPDATED**: DATE
- **LAST_UPDATED_BY**: VARCHAR2 (20 BYTE)

### WORKSPACE 2 CONTRACT GRANT
- **WORKSPACE_ID**: NUMBER (38)
- **CONTRACT_GRANT_ID**: NUMBER (38)
- **DATE_CREATED**: DATE
- **CREATED_BY**: VARCHAR2 (20 BYTE)
- **DATE_LAST_UPDATED**: DATE
- **LAST_UPDATED_BY**: VARCHAR2 (20 BYTE)

### WORKSPACE 2 EXPERIMENT
- **WORKSPACE_ID**: NUMBER (38)
- **EXPERIMENT_ACCESSION**: VARCHAR2 (15 BYTE)
- **UPLOAD_TICKET_NUMBER**: VARCHAR2 (100 BYTE)
- **DATE_CREATED**: DATE
- **CREATED_BY**: VARCHAR2 (20 BYTE)
- **DATE_LAST_UPDATED**: DATE
- **LAST_UPDATED_BY**: VARCHAR2 (20 BYTE)

### WORKSPACE 2 EXPSAMPLE
- **WORKSPACE_ID**: NUMBER (38)
- **EXPSAMPLE_ACCESSION**: VARCHAR2 (15 BYTE)
- **UPLOAD_TICKET_NUMBER**: VARCHAR2 (100 BYTE)
- **DATE_CREATED**: DATE
- **CREATED_BY**: VARCHAR2 (20 BYTE)
- **DATE_LAST_UPDATED**: DATE
- **LAST_UPDATED_BY**: VARCHAR2 (20 BYTE)

### WORKSPACE 2 FILE INFO
- **WORKSPACE_ID**: NUMBER (38)
- **FILEINFO_ID**: NUMBER (38)
- **UPLOAD_TICKET_NUMBER**: VARCHAR2 (100 BYTE)
- **DATE_CREATED**: DATE
- **CREATED_BY**: VARCHAR2 (20 BYTE)
- **DATE_LAST_UPDATED**: DATE
- **LAST_UPDATED_BY**: VARCHAR2 (20 BYTE)

### WORKSPACE 2 LAB TEST PANEL
- **WORKSPACE_ID**: NUMBER (38)
- **LAB_TEST_PANEL_ACCESSION**: VARCHAR2 (15 BYTE)
- **UPLOAD_TICKET_NUMBER**: VARCHAR2 (100 BYTE)
- **DATE_CREATED**: DATE
- **CREATED_BY**: VARCHAR2 (20 BYTE)
- **DATE_LAST_UPDATED**: DATE

### 3.3.1.10. Lookup Tables - Part 1

There are approximately 65 tables in the IMMPORT_CORE schema, that ImmPort calls lookup tables, but other groups may refer to as controlled vocabulary tables. These tables are used to help harmonize the data from study to study. For many of the base tables ImmPort has both a reported_name and preferred_name and the preferred name is mapped to one of the lookup tables. In addition, several lookup tables are populated using terms from ontologies.

### System Architecture and Software Design Specification
### LK_DATA_COMPLETENESS
- **ID**: NUMBER (38)
- **DESCRIPTION**: VARCHAR2 (1000 BYTE)
- **DATE CREATED**: DATE
- **CREATED BY**: VARCHAR2 (20 BYTE)
- **DATE LAST_UPDATED**: DATE
- **UPDATED BY**: VARCHAR2 (20 BYTE)

### LK_DISEASE
- **NAME**: VARCHAR2 (250 BYTE)
- **DISEASE_ONTOLOGY_ID**: VARCHAR2 (50 BYTE)
- **DESCRIPTION**: VARCHAR2 (1000 BYTE)
- **LINK**: VARCHAR2 (2000 BYTE)
- **DATE CREATED**: DATE
- **CREATED BY**: VARCHAR2 (20 BYTE)
- **DATE LAST_UPDATED**: DATE
- **UPATED_BY**: VARCHAR2 (20 BYTE)
- **HUMAN_PHENOTYPE_ID**: VARCHAR2 (50 BYTE)

### LK_DISEASE_STAGE
- **NAME**: VARCHAR2 (50 BYTE)
- **DESCRIPTION**: VARCHAR2 (1000 BYTE)
- **LINK**: VARCHAR2 (2000 BYTE)
- **DATE CREATED**: DATE
- **CREATED BY**: VARCHAR2 (20 BYTE)
- **DATE LAST_UPDATED**: DATE
- **UPATED_BY**: VARCHAR2 (20 BYTE)

### LK_ETHNICITY
- **NAME**: VARCHAR2 (50 BYTE)
- **DESCRIPTION**: VARCHAR2 (1000 BYTE)
- **LINK**: VARCHAR2 (2000 BYTE)
- **DATE CREATED**: DATE
- **CREATED BY**: VARCHAR2 (20 BYTE)
- **DATE LAST_UPDATED**: DATE
- **UPATED_BY**: VARCHAR2 (20 BYTE)

### LK_EXP_MEASUREMENT_TECH
- **NAME**: VARCHAR2 (50 BYTE)
- **DESCRIPTION**: VARCHAR2 (1000 BYTE)
- **LINK**: VARCHAR2 (2000 BYTE)
- **DATE CREATED**: DATE
- **CREATED BY**: VARCHAR2 (20 BYTE)
- **DATE LAST_UPDATED**: DATE
- **UPATED_BY**: VARCHAR2 (20 BYTE)

### LK_EXPOSURE_MATERIAL
- **NAME**: VARCHAR2 (50 BYTE)
- **EXPOSURE_MATERIAL_ID**: VARCHAR2 (50 BYTE)
- **DESCRIPTION**: VARCHAR2 (1000 BYTE)
- **LINK**: VARCHAR2 (2000 BYTE)

3.4. Aspera Server

We integrated technology from Aspera, an IBM company, into the ImmPort system architecture. The Aspera Connect Server using the patented FASP® technology allows for optimized data transfer speeds across the Internet; we have utilized this technology for data submission and data downloads for large files.

The Aspera security infrastructure provides user authentication and permissions on file systems. A free Aspera Connect Client provides a plug-in for users to install locally to take advantage of the FASP® UDP.
based transfer optimization. The Aspera SDK is utilized currently for accessing the Aspera Connect Server from the ImmPort application and data submission servers to queue up transfer tasks and return results to users.

More detailed documentation regarding the Aspera Connect Server, the Aspera SDK, FASP® technology, and the Aspera Connect Client can be found online at [www.ibm.com/products/aspera](http://www.ibm.com/products/aspera).

### 3.5. HOSTED APPLICATIONS

#### 3.5.1. ImmPort Core Query API

The Core Query API provides programmatic access to Core ImmPort Data. This API works as a SQL query tool to access data in the relational database (Oracle). The API returns a tab delimited output by default. The Core Query API endpoints can be accessed directly by a user or by an application. All requests to the Core Query API require authentication and the Core Query API uses tokens for authentication. Users obtain tokens by posting to the ImmPort Authentication URL [https://auth.immport.org/auth/token](https://auth.immport.org/auth/token) with a username and password. They must include the authentication token as an Authorization: bearer in the custom HTTP header.

#### 3.5.1.1. Feature Summary

The primary function of the core query api as currently developed is to assist curators in executing and saving database SQL queries that help with daily operational tasks in getting data collected, QC’ed, shared and curated. Based on usefulness to the internal curation team, it can be evaluated over time if the application would also be useful for external users.

The endpoints of the API are listed below

<table>
<thead>
<tr>
<th>HTTP URL</th>
<th>Parameters (pass in the body of the request)</th>
<th>Description</th>
<th>GET/POST</th>
</tr>
</thead>
<tbody>
<tr>
<td>/query/delete/{queryID}</td>
<td></td>
<td>Deletes the query with the specified query id stored in the database</td>
<td>GET</td>
</tr>
<tr>
<td>/query/id/{queryId}</td>
<td></td>
<td>Get backs the query object in json format</td>
<td>GET</td>
</tr>
<tr>
<td>/query/all</td>
<td></td>
<td>Gets all the query objects</td>
<td>GET</td>
</tr>
<tr>
<td>/query/username/{username}</td>
<td></td>
<td>Gets all the query objects for the specified username</td>
<td>GET</td>
</tr>
</tbody>
</table>
| /query/add | JSON Query Object Example : { 
"queryName": "Study query",
"queryDescription": "study query",
"querySql": "select * from study where study_accession = '{study_accession}'"
} | Adding a query object to be stored in the database | POST     |
| query/update | JSON Query Object | Updating query object in the database. The json object passed in | POST     |
3.5.1.2. ImmPort Core Query API Software Architecture

The purpose of this API is to execute SQL queries dynamically and return tab delimited results back. The execute endpoint is called with a query id, the parameterized query is retrieved from the database and the parameters values passed in the POST body are replaced in the query string. The executeSql endpoint has the SQL query that needs to be executed in the body of the POST. The response to both endpoints are tab delimited results. The return columns specified in the query can be of different types and column type is determined by the ResultSetMetaData from the resultset when the query is executed. The fetch size is set to one so the results can be streamed to the response without an overhead on the memory on the server where the application is running.
3.5.2. Data Submission

The ImmPort data collection and sharing process is the product of extensive interaction, discussion, prototyping, and refinement with the DAIT POs, data providers and researchers who use the shared data. In order to encourage standardization of terms and vocabulary the ImmPort team developed a set of templates to capture, name, and define key elements of biomedical research data. The templates are informed by community standards where available. The ImmPort team engages with data standards communities such as the HIPC Standards Working Group, ISA Tools, CDISC, the minimal information standard groups, CEDAR, the Antibody Registry, and ontology developers to explore how to enhance the description of data captured in the templates. Templates are provided in a Microsoft Excel version to provide inline comments, validation, and ease-of-use features such as dropdown lists and color-coding of related data fields. The operational version of the templates is a simple tab separated value format that is widely used in bioinformatics.

Each template is fully documented consistent with the requirements of NIAID and the research community. Explanations include the purpose of the template, structure of the template (e.g. section, column, and row names), elements of the template required, whether numeric, preferred vocabulary or free text should be entered into a data field, how data elements are linked to each other across templates, and a glossary of terms and their reference sources. All templates, reference guides and example completed templates are version controlled and published when a software release is deployed.
Detailed information on data submission and templates are available at https://www.immport.org/resources/dataTemplates. Online interactive information for the templates is available at https://www.immport.org/shared/templateDocumentation.

3.5.2.1. Validation

A Batch Upload consists of a single Template file or group of Template file(s) and zero or more data file(s) provided in a zip-file or folder. Data files are either required by the template file(s) or designated as archive file(s). A Template file is a self formatted file consisting of a header segment, column specification and data column rows. Batch upload validation consists of validating all data in the set of templates and associated file before any data is uploaded into Oracle database and ImmPort file system. If any data in a Batch Upload fails validation no data is uploaded into Oracle database or file loaded into ImmPort file system by the the batch uploader. The set of all possible ImmPort templates have a specific validation and upload order. That is, data in one template must be loaded into the Oracle database prior to another template being uploaded since data in a latter template can depend upon data in a former template. All data within a Batch Upload must be valid to be uploaded into the Oracle database and ImmPort file system. Data in each template is uploaded into one or more Oracle database tables and files associated with the template are uploaded into the ImmPort file system. The data in a Batch Upload is valid if all the foreign keys for the set of Oracle tables to be loaded are satisfied and no duplicate rows are to be loaded into the set of Oracle database tables. Data columns within a template are mapped to one or more Oracle database table(s) columns. Several of these table columns are required to satisfy a controlled vocabulary. That is, the table column has a foreign key constraint to a Oracle database (lookup) controlled vocabulary. The Oracle tables have other foreign key constraints defined between the Oracle tables that provide parent-child relationships among the tables (for example, experiment_accession in EXPSAMPLE is related to experiment_accession in experiment).

Validation requirements for each template are specified declaratively in XML. The XML specification provides the following: declaration of row uniqueness, the specification of generation of unique ID's for table rows, parent-child foreign key requirements, rules that must be satisfied on the template columns to be valid for upload, processes to process template columns into database columns and make further checks, and controlled vocabulary checks. The XML also specifies the mapping of template columns to database table(s) columns, and the specific validation queries that support parent-child foreign key requirements. The XML specification is currently implemented in the Batch Uploader Java software system.

A validation service, where no data is uploaded into the Oracle database or files are uploaded into ImmPort file system, is provided through the Data Manager and Batch Upload API. The Data Manager uses Batch Upload API to perform the validation.

3.5.2.2. Submission

Data Upload Submission is provided through the Data Manager and the Batch Uploader API. A Batch Upload Submission submits the file or folder to the upload zone and registers the upload job as pending in the Oracle database. The Batch Upload back-end server performs the validation as specified above and, if the upload is valid, it loads the data into the Oracle database and associated file(s) into ImmPort file system. The back-end Batch Upload server processes uploads through a cyclic basic (cron job). The submission process wakes every five (5) minutes and processes all pending Batch Uploads in submission timestamp order. This allows upload submissions to depend on one another.
The software architecture of the Batch Uploader server provided below.

### 3.5.3. Data Batch Update

The Data Batch Updater provides the mechanism for updating Oracle database tables (update, delete, and insert special linkages) after they have been uploaded by the Batch Uploader. The Data Batch Updater also allows for management of controlled vocabulary (lookup) tables (insert, update, and delete). A Data Batch Updater upload consists of a single formatted text-file that specifies an operation on a single Oracle database table that will perform either updates, insertions, or deletions. As with the Batch Uploader the operations on the Oracle database tables are specified declaratively in XML and implemented in the Data Batch Updater Java software system. The Batch Updater does not affect columns in the Oracle database that specify path information for associated files residing in the ImmPort file system. Also, the batch updater does not delete any row in an Oracle database table that contains ImmPort file system path information (See File System Management Update).

#### 3.5.3.1. Validation

As with the Batch Uploader, the Batch Updater performs a validation phase on the batch updater file. These validations include: check duplicate rows by primary key or unique indices, check required columns, check foreign keys on columns of rows being inserted or updated, and in the case of deletion that there are no foreign key linkages involving the row being deleted with other Oracle database tables. If all validations are successful the updater file is uploadable. A validation service, where no data is uploaded or modified in the Oracle database, is provided through the Data Manager and Batch Updater API. The Data Manager uses Batch Updater API to perform the validation.

#### 3.5.3.2. Submission

Batch Updater Submission is provided through the Data Manager or the Batch Updater API. The submission includes putting the updater file into the upload zone and registering a pending Batch Updater job in the Oracle database. A Data Batch Updater upload back-end server processes the pending Batch Updater jobs. The server validates the updater job and, if validated, processes it into an Oracle database. The back-end Batch Updater server manages batch
update jobs through a cyclic (cron) process. The server wakes every five (5) minutes and processes all the pending updater jobs in submission timestamp order. This allows updater submissions to depend on one another.

The software architecture of the Batch Updater server provided below.

![Software Architecture Diagram]

3.5.4. File System Management Update

The File System Management Update Application manages updates to the Oracle database and ImmPort file system, keeping the two consistent between each other. The File System Management Update Application performs the following operations each identified as a single File System Management Update submission:

**Remove Workspace**
Remove Workspace operation removes the current content of Oracle database and the associated files in the ImmPort file system specific to the workspace and leaves the workspace empty to be operated on again. An option allows the workspace to be removed completely from the Oracle database and ImmPort file system. In the latter case the workspace no longer exists in the ImmPort file system.

**Remove Upload Ticket Number**
Remove Upload Ticket Number removes all Oracle database table content and associated files in the ImmPort file system related to the upload ticket. Only the recent completed upload ticket for a given workspace can be removed, after which it is marked as deleted.

**Remove Study**
Remove Study removes all the Oracle database table content and associated files in ImmPort file system related to a given study.

**Remove File**
For a given data file stored in the ImmPort file system (file info file (FILE_INFO.FILE_INFO_ID), protocol file (PROTOCOL.PROTOCOL_ACCESSION), study file (STUDY_FILE.STUDY_FILE_ACCESSION), or study image file (STUDY_IMAGE.SCHEMATIC_ACCESSION)), the file is removed from the ImmPort file system, and all linkages to the file in Oracle database for file info and protocol files. Finally, the row in the associated table is removed.

**Remove Multiple Files**
Remove multiple files requires a file comprising one line per ImmPort file system file to remove. Each line is comprised of file ID: file_info_id (FILE_INFO), protocol_accesion (PROTOCOL), study_file_accession (STUDY_FILE), or schematic_accession (STUDY_IMAGE). All files must reside in the same workspace. The operation performs Remove File for each file ID.

Move Archive Files
For files that are designated as archived and stored in FILE_INFO (file detail ::= Archived) can be moved to a result file designation within a workspace. That is, the file can be associated with ASSESSMENT_PANEL (ASSESSMENT_2_FILE_INFO), EXPSAMPLE (EXPSAMPLE_2_FILE_INFO), CONTROL_SAMPLE (CONTROL_SAMPLE_2_FILE_INFO), or STANDARD_CURVE (STANDARD_CURVE_2_FILE_INFO). This operation requires a tab-separated file as input that contains one or more line with the format: (FILE_INFO_ID, ACCESSION, FILE_DETAIL). The FILE_DETAIL comes from the LK_FILE_DETAIL controlled vocabulary table. If a given FILE_INFO_ID repeats in the file, then the set of ACCESSIONS associated with it must belong to the same study, and the associated FILE_DETAIL must be the same. The ACCESSION must satisfy the accession format for the following accessions respectively: ASSESSMENT_PANEL_ACCESSION, EXPSAMPLE_ACCESSION, CONTROL_SAMPLE_ACCESSION, or STANDARD_CURVE_ACCESSION.

Transfer Files
The (result) files can be transferred from one study to another within a workspace. The operation takes a tab-separated file where each line has the format: (FILE_ID, STUDY_ACCESSION). The FILE_ID can be one of the following FILE_INFO_ID (FILE_INFO), STUDY_FILE_ACCESSION (STUDY_FILE), or STUDY_IMAGE (SCHEMATIC_ACCESSION). The STUDY_ACCESSION must differ from the study to which the FILE_ID is currently associated.

Assign CRF Files
This operation transfers study-based file system files in STUDY_FILE and assigns them as a CRF-file to an assessment panel in ASSESSMENT_2_FILE_INFO within the same study. That is, both the study file and assessment panel are in the same study. The operation requires a tab-separated file with the following format: (STUDY_FILE_ACCESSION, ASSESSMENT_PANEL_ACCESSION). All studies must reside within the same workspace.

File System Management Update validates a given operation. Validation includes determining the existence of the object(s) to be operated upon and the specific requirements of the operation. The File System Management Update submission is accessed through the Data Manager that defines the above operations as a single submission. The pending operation is stored in a scheduling table in the Oracle database and any associated file for the operation in the upload zone. The back-end File System Management Update server is a cron process that wakes every five (5) minutes and processes all the pending File System Management Update jobs in submission timestamp order. This allows operation submissions to depend on one another.

The software architecture of the File System Management Server is provided below
3.5.5. Data Manager

The Data Management Server hosts the web application that provides users with the interfaces to submit, query, and edit private research and clinical data to which they have access via a private workspace.

3.5.6. Sharing Tool

The Sharing tool hosts a web application designed to share study data from private workspaces to a collaborative workspace and then to a public workspace. This tool is used during the study data release process. When a set of studies is ready to be publicly shared or re-shared the following process is followed in the sharing tool. A collaborative workspace is created by clicking on the Create Collaborative workspace menu.

The study to be shared is first shared to the newly created Collaborative workspace by clicking on the Share Study button. Before you click the button you will get a report on the details of the study data that are to be shared. If the study is being re-shared the Shared Count column will have non-zero counts indicating how many experiments or lab tests or other study data have already been shared.
The Pre-Check button can be clicked to do some validations on the study data being shared.

Once the study data is shared to the Collaborative workspace, it can be shared to the Public workspace.
All study data shared to the public workspace is exported to the Aurora MySQL database on AWS.

### 3.5.7. User Administration

The User Administration Server hosts the web application designed to manage user registrations, accounts, and project access. The Manage User design artifacts model system administration capabilities which include allowing users to request system access (register), creating user accounts, updating user information, querying users, assigning groups and roles to users and deactivating users from the system. The User Administration Application is a Spring boot application with its frontend coded in AngularJS.

#### 3.5.7.1. Registering User

A user can register to gain access to ImmPort applications. By default the user is assigned the role “ROLE_USER”. One of the access rights this role gives the user is access to the data browser application to download studies. The individual initiates a registration request upon which the user sees the Notice

<table>
<thead>
<tr>
<th>Register User: Notice</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access to ImmPort research and clinical data is available to any user after a brief registration and approval process. You will be asked to accept a data sharing and access agreement before you will be allowed to login to the ImmPort system. If you choose to submit your own data either for eventual sharing or for use of analysis tools, your data will be kept in a confidential private workspace until you choose otherwise. If you have any questions about access or the registration process, contact <a href="mailto:ImmPort_Helpdesk@immport.org">ImmPort_Helpdesk@immport.org</a>.</td>
</tr>
</tbody>
</table>

The system displays a page to gather information about the user. The username and email address are unique to the system so the user cannot add a username or email address that already exists in the system. The system validates the user information and saves the registration request, provided the data submitted are valid. Appropriate error messages are displayed if errors are encountered.
An email is sent to the user to confirm the email address provided. This email contains a link the user needs to click to activate the account.

### Registration Confirmation

**ImmPort_Helpdesk@immport.org**

To me

Dear March Dimes,

Thank you for registering with ImmPort. An account was created for you. Please click on the link below to activate your account.

[Click here to confirm your registration](#)

This is an automated message. Please do not reply to this email, but contact **BISC_HELPDESK@mail.nih.gov** if you have any questions.

### 3.5.7.2. Creating an User by an Administrator

The ImmPort Administrator can create a user and assign appropriate access roles. The admin fills in the appropriate user information and clicks Create User
A user account is created and an email is sent to the user’s email address to set his password. When the user sets his password, his account is activated.
The admin can continue to assign roles to the user. Since the admin selected Data Browser and Data API while creating the user a normal user role is assigned for these applications.

### 3.5.7.3. Search User

A user can be searched by the username, first name, last name and email address. A user once found, can be deactivated and his password can be reset. The admin can click on the Reset Password button and email will be sent to the user’s email to reset his password.

### 3.5.7.4. Applications/Groups/Roles

A group is a means of organizing users whereas a role is usually a means of organising rights. Each role assigns some access rights for an application. Roles are assigned to groups and groups are assigned to applications. For example the User Service Rest API application has two roles REST_ADMIN and REST_USER. REST_ADMIN is assigned to the REST_ADMINS group and REST_USER is assigned to REST_USERS group. If a user mod2021 needs access to the User Service Rest API application as an admin the REST_ADMIN role needs to be assigned to the user. The user will need to be associated with the Application REST and to the group REST_ADMINS. This will give the user mod2021 access to the REST_ADMIN role.
3.5.8. APIs

The Batch Uploader and Batch Updater APIs provide programmatic access to the operational capabilities of the Batch Uploader and Batch Updater. The API endpoints can be accessed directly by a user or by an application (for example, Data Manager). All requests to these APIs require authentication. The Core APIs use tokens for authentication. Users can obtain tokens by posting to the ImmPort Authentication URL - https://auth.immport.org/auth/token with a username and password. They must include the authentication token as an Authorization: bearer in the custom HTTP header.

3.5.8.1. Batch Uploader API

The endpoints of the Batch Uploader API are listed below.

<table>
<thead>
<tr>
<th>HTTP URL</th>
<th>Parameters (pass in the body of the request)</th>
<th>Description</th>
<th>GET/POST</th>
</tr>
</thead>
<tbody>
<tr>
<td>/data/upload/documentation/templates/WORKSPACE_ID</td>
<td>-F &quot;workspaceId=WORKSPACE_ID&quot;</td>
<td>Documentation Generation: Generate documentation templates for a specific workspace (WORKSPACE_ID)</td>
<td>GET</td>
</tr>
<tr>
<td>/data/upload/type/offline</td>
<td>-F &quot;packageName=PACKAGE_NAME&quot; -F &quot;uploadNotes=UPLOAD_NOTES&quot; -F &quot;uploadPurpose=uploadData&quot; -F &quot;serverName=SERVER_NAME&quot;</td>
<td>Off-line File(s) Upload: Request for an off-line upload; creates upload registration in preparation for receipt of the file</td>
<td>POST</td>
</tr>
<tr>
<td>/data/upload/type/online</td>
<td>-F &quot;packageName=PACKAGE_NAME&quot; -F &quot;uploadNotes=UPLOAD_NOTES&quot; -F &quot;uploadPurpose=uploadData&quot; -F &quot;serverName=SERVER_NAME&quot; -F &quot;file=@UPLOAD_FILE_PATH_ON_CLIENT&quot;</td>
<td>Zip-File Upload: Request upload of a single file; transfers file and creates upload registration and performs upload</td>
<td>POST</td>
</tr>
<tr>
<td>/data/upload/type/online</td>
<td>-F &quot;packageName=PACKAGE_NAME&quot; -F &quot;uploadNotes=UPLOAD_NOTES&quot; -F &quot;uploadPurpose=uploadData&quot; -F &quot;serverName=SERVER_NAME&quot; -F &quot;file=@UPLOAD_FILE_PATH_ON_CLIENT&quot;</td>
<td>Zip-File Upload: Request upload of a zip-file; transfers file and creates upload registration and performs upload</td>
<td>POST</td>
</tr>
<tr>
<td>/data/upload/type/online</td>
<td>-F &quot;packageName=PACKAGE_NAME&quot; -F &quot;uploadNotes=UPLOAD_NOTES&quot; -F &quot;uploadPurpose=uploadData&quot; -F &quot;serverName=SERVER_NAME&quot; -F &quot;file=@UPLOAD_FILE_PATH_ON_CLIENT&quot;</td>
<td>Multiple Files Upload (Single File): Request upload of a single file; transfers file and creates upload registration and performs upload; Note that single file is specified with the following -F parameter, -F &quot;file=@UPLOAD_FILE_PATH_ON_CLIENT&quot;</td>
<td>POST</td>
</tr>
<tr>
<td>/data/upload/type/online</td>
<td>-F &quot;packageName=PACKAGE_NAME&quot; -F &quot;uploadNotes=UPLOAD_NOTES&quot; -F &quot;uploadPurpose=uploadData&quot; -F &quot;serverName=SERVER_NAME&quot; -F &quot;file=@UPLOAD_FILE_PATH_ON_CLIENT&quot;</td>
<td>Multiple Files Upload (Multiple Files): Request upload of a several files; transfers files and creates upload registration and performs upload;</td>
<td>POST</td>
</tr>
</tbody>
</table>
The software architecture for the Batch Upload API is similar to the ImmPort Core Query API.
### 3.5.8.2. Batch Updater API

The endpoints of the Batch Updater API are listed below.

<table>
<thead>
<tr>
<th>HTTP URL</th>
<th>Parameters (pass in the body of the request)</th>
<th>Description</th>
<th>GET/POST</th>
</tr>
</thead>
<tbody>
<tr>
<td>/data/batch/updater/documentation/templates</td>
<td>-F &quot;workspaceId=WORKSPACE_ID&quot; -F &quot;uploadNotes=UPLOAD_NOTES&quot; -F &quot;uploadPurpose=batchUpdateUpload&quot; -F &quot;serverName=SERVER_NAME&quot; -F &quot;file=@UPLOAD_BATCH_UPDATER_FILE_PATH_ON_CLIENT&quot;</td>
<td>Documentation Generation: Generate documentation templates</td>
<td>GET</td>
</tr>
<tr>
<td>/data/batch/updater</td>
<td>-F &quot;workspaceId=WORKSPACE_ID&quot; -F &quot;packageName=&quot; -F &quot;uploadNotes=UPLOAD_NOTES&quot; -F &quot;uploadPurpose=batchUpdateUpload&quot; -F &quot;serverName=SERVER_NAME&quot; -F &quot;file=@UPLOAD_BATCH_UPDATER_FILE_PATH_ON_CLIENT&quot;</td>
<td>Batch Update Upload: Request upload of a zip-file; transfers file and creates upload registration and performs batch update requested</td>
<td>POST</td>
</tr>
<tr>
<td>/data/batch/updater</td>
<td>-F &quot;workspaceId=WORKSPACE_ID&quot; -F &quot;packageName=&quot; -F &quot;uploadNotes=UPLOAD_NOTES&quot; -F &quot;uploadPurpose=batchUpdateValidate&quot; -F &quot;serverName=SERVER_NAME&quot; -F &quot;file=@UPLOAD_BATCH_UPDATER_FILE_PATH_ON_CLIENT&quot;</td>
<td>Batch Update Upload for Validation: Batch update validation is a two step process where the batch update file is uploaded to the server and the upload registration generated (this endpoint), and then the validation is requested (see Validation of Upload Ticket endpoint)</td>
<td>POST</td>
</tr>
<tr>
<td>/data/batch/updater/validation</td>
<td>-F &quot;uploadTicketNumber=UPLOAD_TICKET_NUMBER&quot;</td>
<td>Validation of Upload Ticket: Validation a batch updater file that is identified by the upload ticket number; Note this endpoint uses the -F parameter, -F &quot;uploadTicketNumber=UPLOAD_TICKET_NUMBER&quot;</td>
<td>POST</td>
</tr>
<tr>
<td>/data/batch/updater/registration/UPLOAD_TICKET_NUMBER/status</td>
<td></td>
<td>Status of Upload Ticket: Return the current status of an upload</td>
<td>GET</td>
</tr>
<tr>
<td>URL</td>
<td>Description</td>
<td>Method</td>
<td></td>
</tr>
<tr>
<td>-----</td>
<td>-------------</td>
<td>--------</td>
<td></td>
</tr>
<tr>
<td><code>/data/batch/updater/registration/UPLOAD_TICKET_NUMBER/summary</code></td>
<td>Summary Information on Upload Ticket: On completed jobs (either Completed or Rejected), provide the information on the upload ticket (UPLOAD_TICKET_NUMBER)</td>
<td>GET</td>
<td></td>
</tr>
<tr>
<td><code>/data/batch/updater/registration/UPLOAD_TICKET_NUMBER/database</code></td>
<td>Database Information on Upload Ticket: On completed jobs (Completed only) provide database information (UPLOAD_TICKET_NUMBER)</td>
<td>GET</td>
<td></td>
</tr>
<tr>
<td><code>/workspaces</code></td>
<td>Set of Workspaces: Return the set of workspace(s) on which a user can perform and upload or validation</td>
<td>GET</td>
<td></td>
</tr>
</tbody>
</table>

The software architecture for the Batch Upload API is similar to the ImmPort Core Query API.

---

**Error:** The page contains a table and a diagram. The table lists URLs with descriptions and methods. The diagram illustrates the system architecture, showing a Spring Boot Application - Resource Server - Rest API connected to an Oracle Database Server and a (Network) File System. The diagram includes an HTTP request and response flow.
